

AI Engineer - Technical Assessment

The Task

Build a FastAPI chatbot with a single endpoint - `POST /ask` - that accepts a natural language question and returns a response.

The bot should be able to answer questions about a text dataset of your choice, and questions about superheroes. It should figure out what the question is about and use the right source - or both.

For superhero data, use the [Superhero API](#) (`/api/{token}/search/{name}`). Sign in with GitHub to get a free key.

The bot must call a real hosted LLM endpoint - not a local model. Free options that require only an email to sign up: Groq, Google Gemini AI Studio, Cerebras, NVIDIA NIM.

Every response must include where the information came from.

What We Expect

The submission does not need to be perfect. It should work, and you should be able to explain every decision you made - including the corners you cut and why.

Think of it as 80-90% production-ready: validations in place, sensible error handling, and a few test cases covering the core logic of the system. You decide what the core logic is.

README

Keep it short. Include how to set up the project, how to run it, and a brief description of what it does. Screenshots are welcome if they help. Do not write a comprehensive summary of the codebase - the reviewer will read the code directly.

AI Usage Policy

You are responsible for the design of this system. You can use AI tools for scaffolding, boilerplate, and implementation help - but the architecture, decisions, and tradeoffs are yours to own.

In the next interview round, you will be asked to explain your solution in detail. If you cannot explain a part of it, or if the code is clearly fully AI-generated with no evidence of your own judgment, it will be scored negatively.

Submission

Push to a public GitHub repository named `ai-engineer-assessment-<your-name>`. We should be able to clone and run it.

Questions

Reach out if you are blocked on environment setup.
